

Calculus One – Graphing the derivative of a function.

1) Given the graph of $f(x)$ below, complete the chart, estimating the derivative (slope of the tangent line) at the given values of x . It is sometimes helpful to use your pencil as a tangent line. After completing the chart, graph the ordered pairs in the chart. Connecting the points with a smooth curve will graph the derivative of $f(x)$.

What do you notice about the y-value of the graph of the derivative when the function reaches a relative maximum?

zero

What do you notice about the y-value of the graph of the derivative when the function reaches a relative minimum?

zero

What do you notice about the y-values of the graph of the derivative when the function is increasing?

positive

What do you notice about the y-values of the graph of the derivative when the function is decreasing?

negative

2. The graph of f is shown in the figure. Select the graph of the derivative from the graphs below. A blank grid has been provided for you to work on.

3. The graph of f is shown in the figure. Select the graph of the derivative from the graphs below. A blank grid has been provided for you to work on.

A)

B)

C)

D)

E)

4. The graph of f is shown in the grid on the left. Sketch the derivative in the grid on the right.

Following web sites will allow you to practice graphing the derivative of a function. Follow the directions at the site: http://www.joma.org/images/upload_library/4/vol4/kaskosz/derapp.html

You can practice matching derivatives with their respective graphs with these on line puzzles. Double-Click on the icon for puzzle 1 – then you may have to open it from the status bar at the bottom of the screen. Work puzzle 1, repeat for puzzle 2 and 3. <http://www.univie.ac.at/future.media/moe/galerie/diff1/diff1.html>

This site gives you the steps to graph the derivative of a function on your graphing calculator. mathbits.com/mathbits/tisection/Calculus/DerivativeGR.htm
